

Ellie Parobek

A successful project I had is one I did during my coop. The project was solely on me to code and program but I had a team of 2 other coworkers who had been in the field for a long time who were looking over me. We used Jira to manage each task I had as we worked in an agile environment. Every other day, we would have a stand up to meet and discuss what next steps I needed to take towards the project and which requirements were the most important. The project I was working on was for my other coworkers so in a way they provided user input, requirements, and knew the expectations of my work. Agile development made it so each milestone was something small and focused so we could code review everything in detail and make sure each objective was clear. My coworkers helped a ton by reviewing my work often and providing the resources needed to succeed.
